| Tunisia | 37 | 42 |
| Japan | 60 | 38 |
| Mexico | 60 | 34 |
| pew research center q26. |  |  |

Skepticism for capitalism is lowest in Brazil (22\%), China (19\%), Germany (29\%) (although East Germans are less supportive than West Germans) and the U.S. (24\%). Skepticism for free markets is highest in Mexico (60\%) and Japan (60\%).

## Example 1: Pew Research

Market Economy?

Skepticism for capitalism is lowest in Brazil (22\%), China (19\%), Germany (29\%) (although East Germans are less supportive than West Germans) and the U.S. (24\%). Skepticism for free markets is highest in Mexico (60\%) and Japan (60\%).

## Announcements

## Final project

## Design new visualization method (e.g. software)

- Pose problem, Implement creative solution
- Design studies/evaluations less common but also possible (talk to us)

## Deliverables

$\square \quad$ Implementation of solution

- 6-8 page paper in format of conference paper submission
$\square$ Project progress presentations

## Schedule

- Project proposal: Mon 11/6
$\square$ Project progress presentation: 11/13 and 11/15 in class (3-4 min)
- Final poster presentation: 12/6 Location: Lathrop 282
- Final paper: 12/10 11:59pm

## Grading

- Groups of up to 3 people, graded individually
- Clearly report responsibilities of each member

## Color

## Color in Visualization

Identify, Group, Layer, Highlight

## Purpose of Color

To label
To measure
To represent and imitate
To enliven and decorate
"Above all, do no harm."

- Edward Tufte

## Topics

Color Perception
Color Naming
Using Color in Visualization

## Physical World

Light is radiation in range of wavelengths

Light of single wavelength is monochromatic

## Retina

## Cone Response

Integrate cone response with input spectra

## Computing Cone Response

Integrate cone response with input spectra

## Opponent processing

LMS are linearly combined to create:
Lightness
Red-green contrast
Yellow-blue contrast

Fairchild

## CIE LAB and LUV color spaces

Standardized in 1976 to mathematically represent opponent processing theory

## Axes of CIE LAB

Correspond to opponent signals
L* = Luminance
$a^{*}=$ Red-green contrast
b* = Yellow-blue contrast
Scaling of axes to represent "color distance" JND = Just noticeable difference (~2.3 units)

## Pseudo-Perceptual Color Spaces

## Hue, Value, Chroma

## Psuedo-Perceptual Models

HLS, HSV, HSB
NOT perceptual models
Simple renotation of RGB
$\square$ View along gray axis

- See a hue hexagon
$\square$ L or V is grayscale pixel value
Cannot predict perceived lightness

## Perceptual brightness

HSL
Lightness

(Photoshop)

## Perceptual brightness

## Perceptual brightness

L* (CIE LAB)

## Simultaneous Contrast

The inner and outer thin rings are the physical purple

## Simultaneous Contrast

## Simultaneous Contrast

## Color Appearance

More than a single color
$\square$ Adjacent colors (background)
$\square$ Viewing environment (surround)
Appearance effects
$\square$ Adaptation
$\square$ Simultaneous contrast
$\square$ Spatial effects
Color in context

Color Appearance Models Mark Fairchild

## Bezold Effect

## Crispening

Perceived difference depends on background

From Fairchild, Color Appearance Models

## Spreading

Adjacent colors blend

Spatial frequency

- The paint chip problem
- Small text, lines, glyphs

## Mapping Data to Color (Rainbows)

## Avoid rainbow color maps!

1. People segment colors into classes
2. Hues are not naturally ordered
3. Different lightness emphasizes certain scalar values
4. Low luminance colors (blue) hide high frequencies

## Rainbow vs. Diverging Color Scale

[Borkin 11]

## Rainbow vs. Diverging Color Scale

Fig. 7. Average percent of low ESS regions identified broken down
by 2D and 3D representation, and color. Error bars correspond to
the standard error and the asterisks indicate results of statistical sig-
nificance. Participants were more accurate in 2D and when using the
diverging color map.

## Phase Diagrams (hue scale)

Singularities occur where all colors meet

The optical singularities of bianisotropic crystals, by M. V. Berry

## Phases of the Tides

Figure 1.9. Cotidal chart. Tide phases relative to Greenwich are plotted for all the world' s oceans. Phase progresses from red to orange to yellow to green to blue to purple. The lines converge on anphidromic points, singularities on the earth' s surface where there is no defined tide. [Winfree, 1987 \#1195 , p. 17].

## Classing quantitative data

Age-adjusted mortality rates for the United States

## Quantitative color encoding

Sequential color scale
Constrain hue, vary luminance/saturation
Map higher values to darker colors

Diverging color scale
Useful when data has a meaningful "midpoint"
Use neutral color (e.g., grey) for midpoint
Use saturated colors for endpoints
Limit number of steps in color to 3-9

## Color Brewer

## Sequential color scheme

## Sequential color scheme

## Design of sequential color scales

Hue-Lightness (Recommended)
Higher values mapped to darker colors
ColorBrewer schemes have 3-9 steps
Hue Transition
Two hues
Neighboring hues interpolate better Couple with change in lightness

## Diverging color scheme

## Diverging color scheme

## Diverging color scheme

Hue Transition
Carefully handle midpoint

- Critical class

Low, Average, High
'Average' should be gray
$\square$ Critical breakpoint
Defining value e.g. 0
Positive \& negative should use different hues
Extremes saturated, middle desaturated

## Hints for the colorist

Use only a few colors ( $\sim 6$ ideal)
Colors should be distinctive and namable
Get it right in black and white
Respect the color blind
