Assignment 3: Dynamic Queries

Create a small interactive dynamic query application similar to Homefinder, but for SF Restaurant Data.

- Implement interface and produce final writeup
- Submit the application and a final writeup on canvas

Can work alone or in pairs

Due before class on Oct 29, 2018

Final project

New visualization research or data analysis

- Pose problem, Implement creative solution
- Design studies/evaluations

Deliverables

- Implementation of solution
- 6-8 page paper in format of conference paper submission
- Project progress presentations

Schedule

- Project proposal: Mon 11/5
- Project progress presentation: 11/12 and 11/14 in class (3-4 min)
- Final poster presentation: 12/5 Location: Lathrop 282
- Final paper: 12/9 11:59pm

Grading

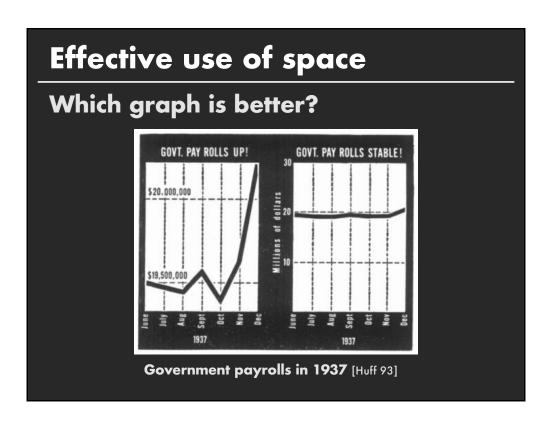

- Groups of up to 3 people, graded individually
- Clearly report responsibilities of each member

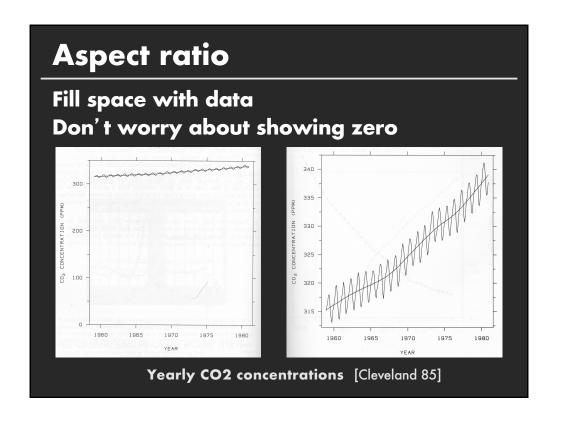

Using Space Effectively: 2D

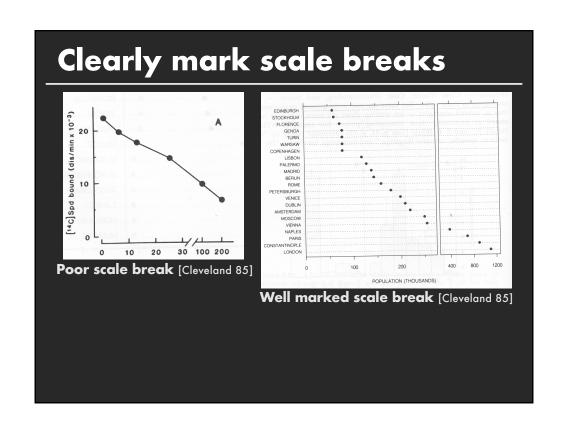

Topics

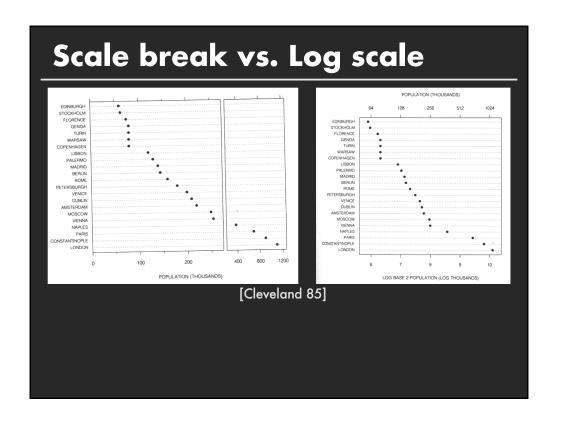

Displaying data in graphs
Selecting aspect ratio
Fitting data and depicting residuals
Graphical calculations
Focus + Context
Cartographic distortion

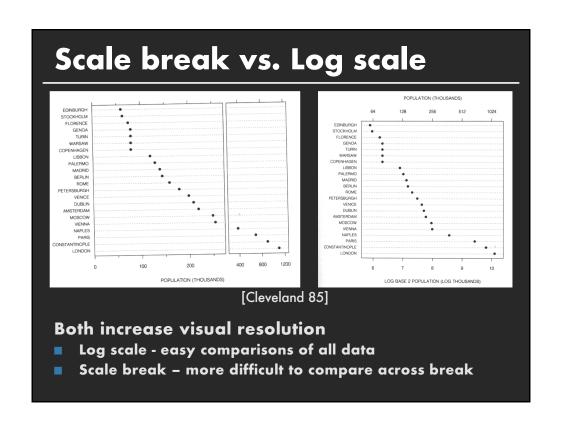

Graphs and Lines

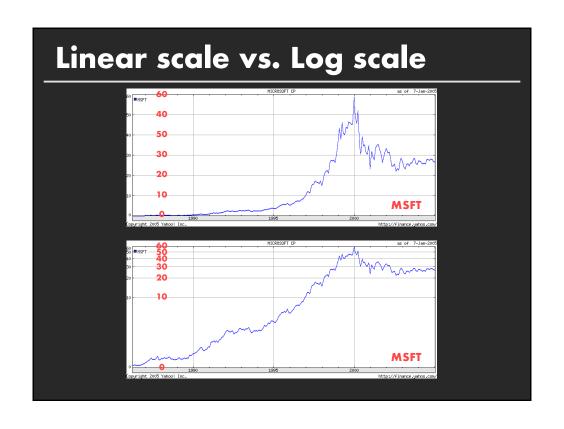

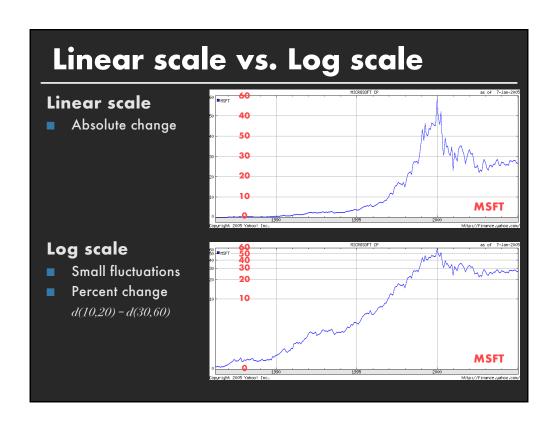

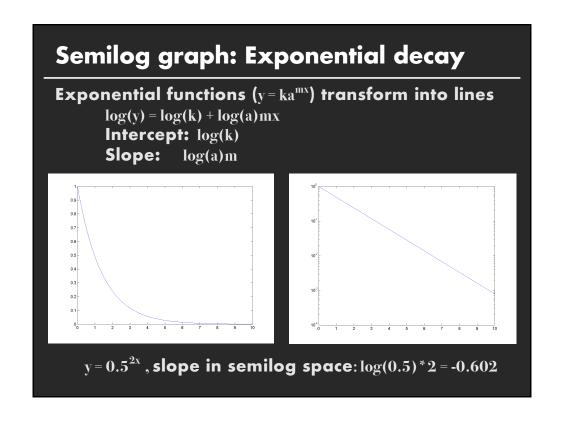

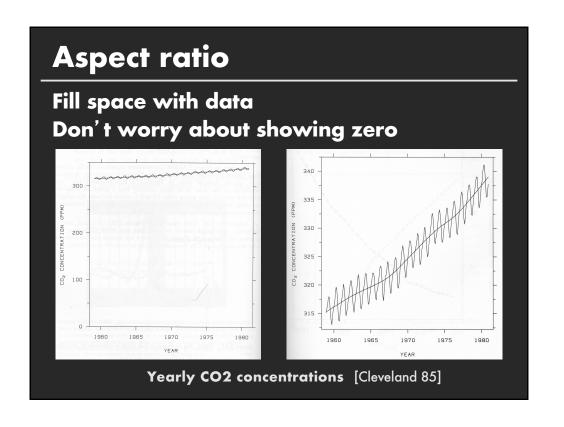

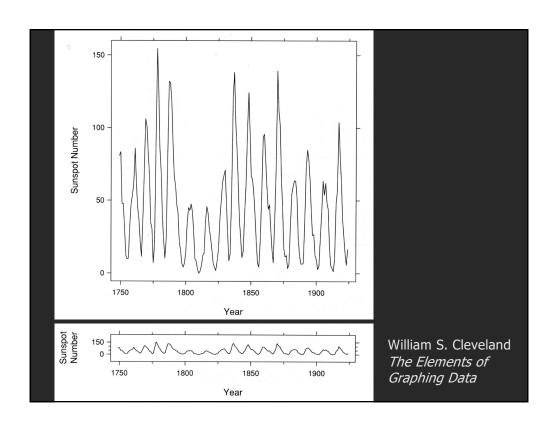

Semilog graph: Exponential growth Exponential functions ($y = ka^{mx}$) transform into lines log(y) = log(k) + log(a)mxIntercept: log(k)Slope: log(a)m

Power functions $(y = kx^a)$ transform into lines Example - Steven's power laws: $S = kI^p \Rightarrow log S = log k + p log I$ Intensity Area Volume Brighness Smell Note the expression of the expr

Selecting Aspect Ratio

Banking to 45° [Cleveland]

To facilitate perception of trends, maximize the discriminability of line segment orientations

Two line segments are maximally discriminable when avg. absolute angle between them is 45°

Optimize the aspect ratio to bank to 45°

Aspect-ratio banking techniques

Median-Absolute-Slope

$$\alpha = \text{median} \mid s_i \mid R_x / R_y$$

Average-Absolute-Orientation Unweighted

$$\sum_i \frac{\mid heta_i(lpha)\mid}{n} = 45^\circ$$
 Weighted

$$\frac{\sum_{i} |\theta_{i}(\alpha)| l_{i}(\alpha)}{\sum_{i} l_{i}(\alpha)} = 45^{\circ}$$

$$\sum_{i} |\theta_{i}(\alpha) - \theta_{i+1}(\alpha)|^{2}$$
Requires Iterative

Average-Absolute-Slope

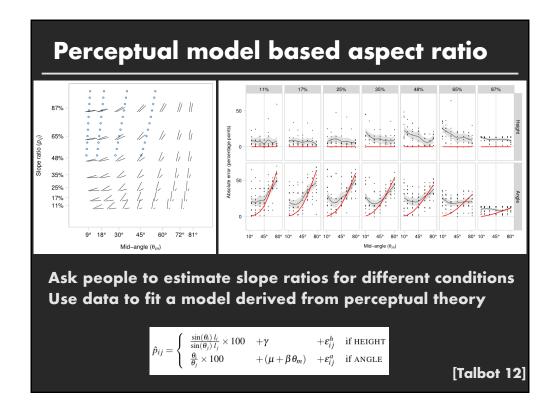

$$\alpha = \text{mean} | s_i | R_x / R_y$$

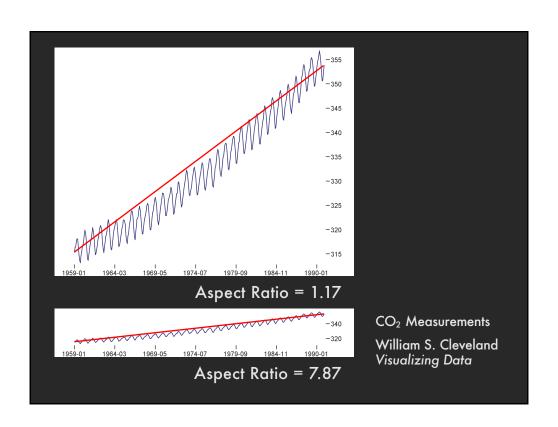

Has Closed Form Solution

Max-Orientation-Resolution Global (over all i, j s.t. i≠j)

$$\sum_i \sum_j | heta_i(lpha) - heta_j(lpha)|^2$$
 Local (over adjacent segments)

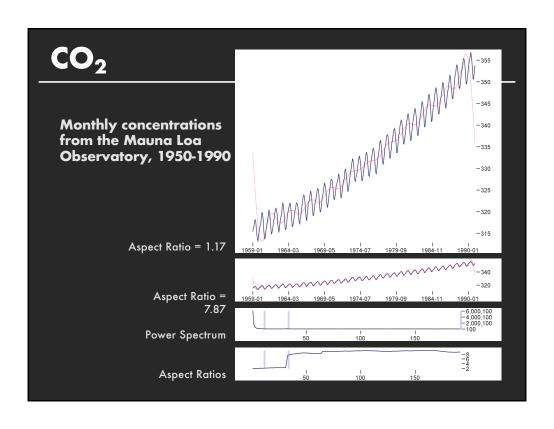

$$\sum_{i} |\theta_{i}(\alpha) - \theta_{i+1}(\alpha)|^{2}$$
Requires Iterative
Optimization

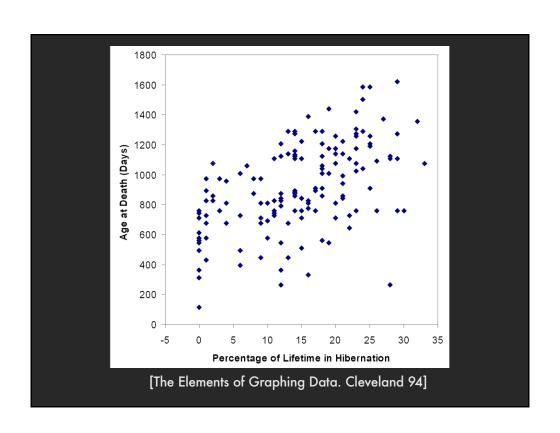

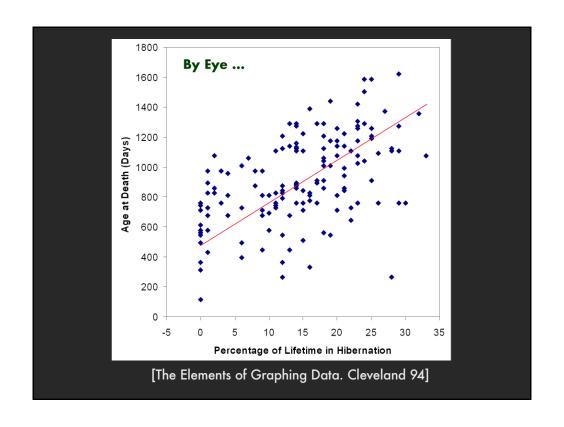

Multi-Scale Banking to 45°

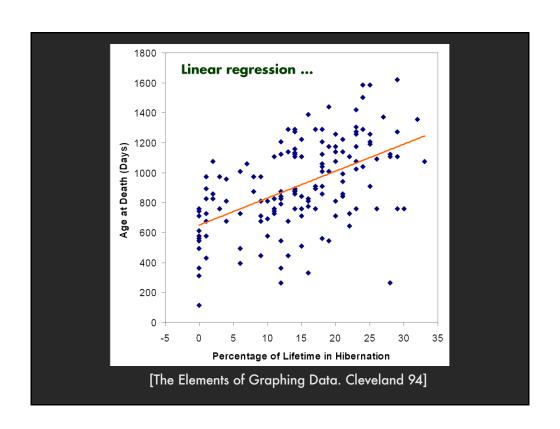

Idea: Use Spectral Analysis to identify trends
Find strong frequency components
Lowpass filter to create trend lines

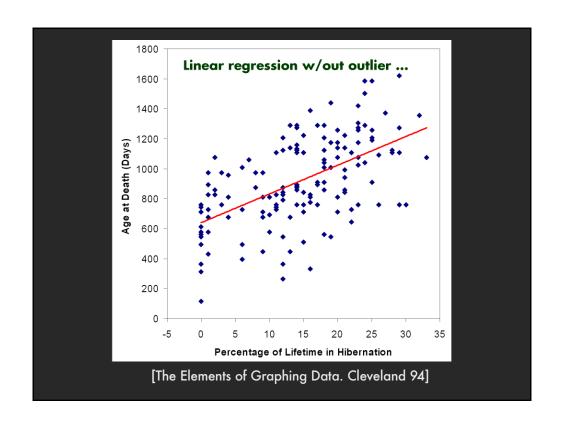

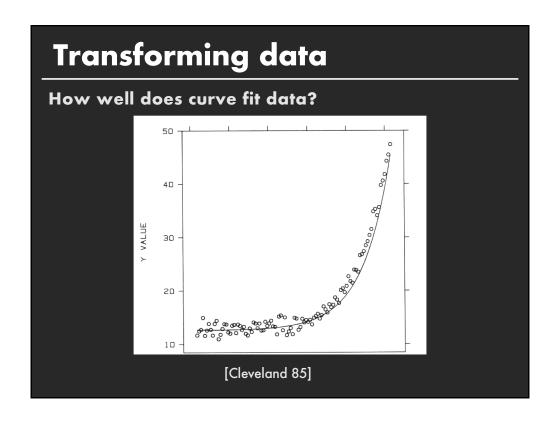

Fitting the Data

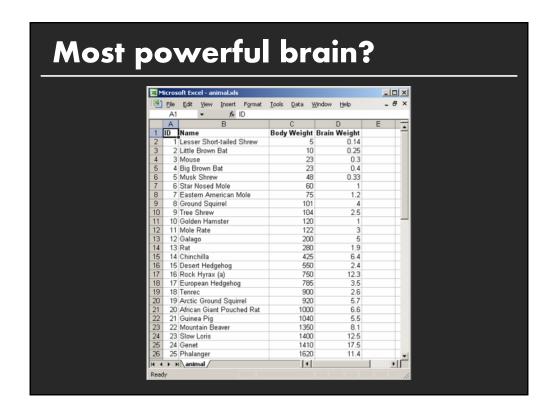

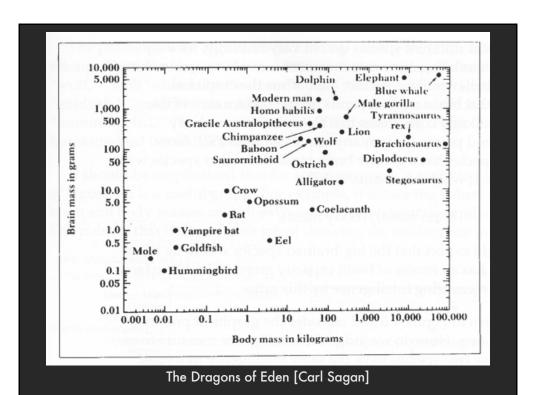

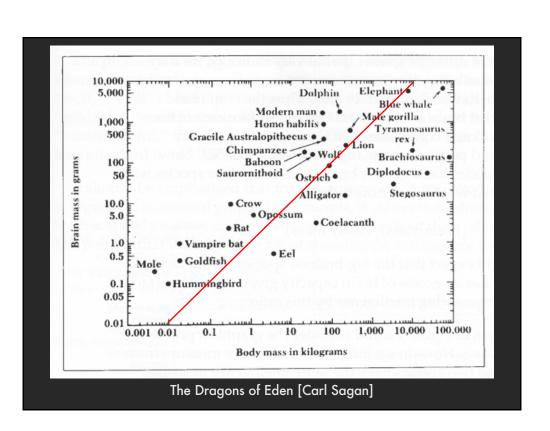

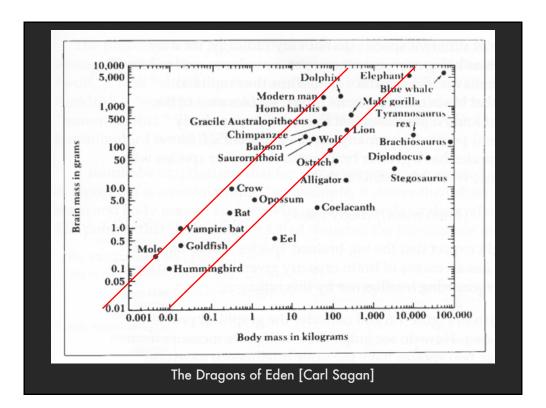

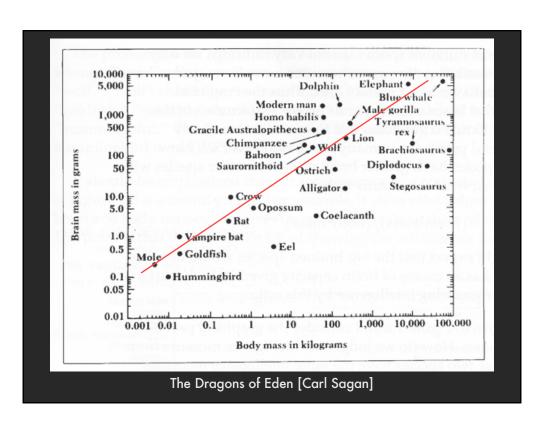

Residual graph Plot vertical distance from best fit curve Residual graph shows accuracy of fit

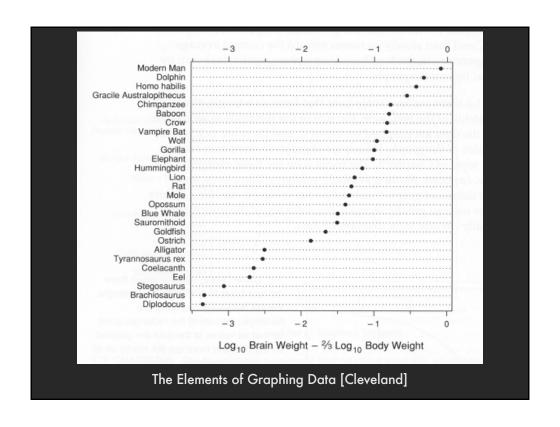

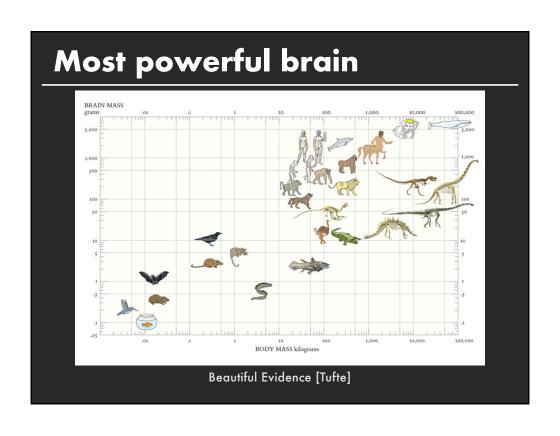

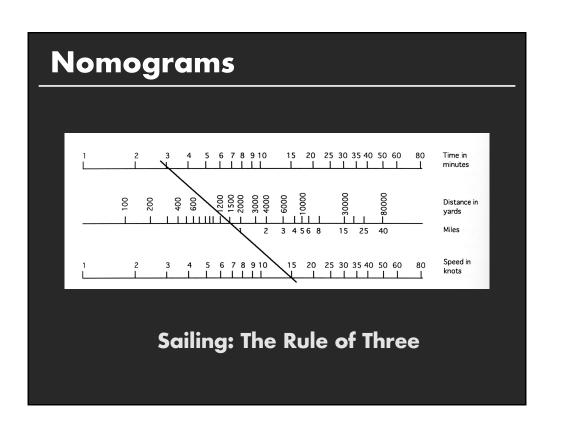

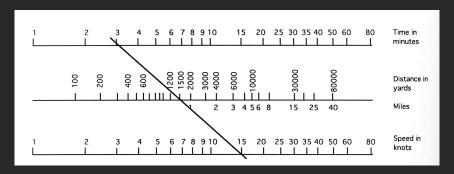

Graphical Calculations

Nomograms

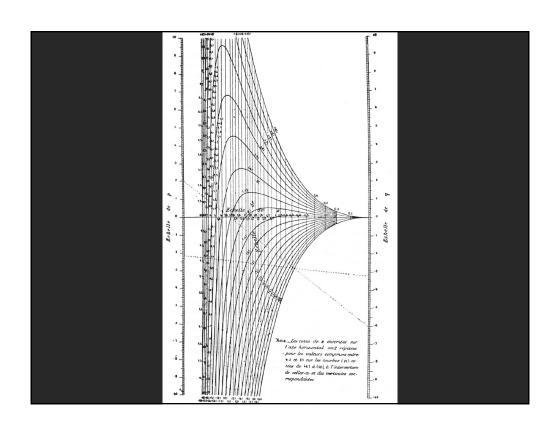

- 1. Compute in any direction; fix n-1 params and read nth param
- 2. Illustrate sensitivity to perturbation of inputs
- 3. Clearly show domain of validity of computation

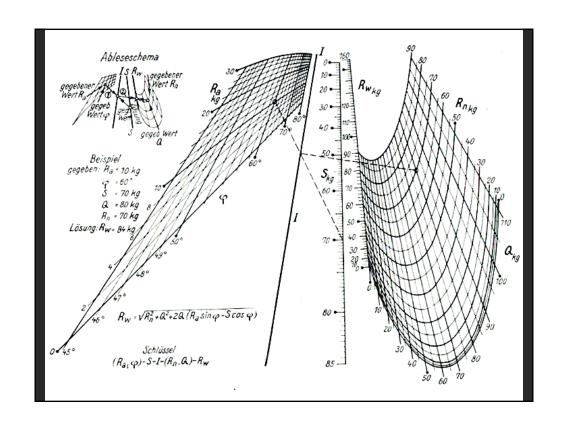

Theory

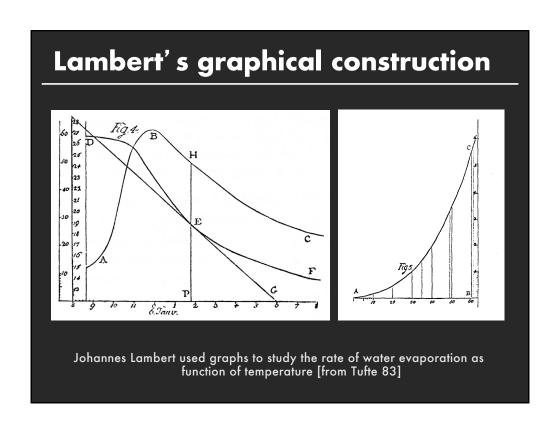

$$\begin{vmatrix} x_1(u) & y_1(u) & w_1(u) \\ x_2(v) & y_2(v) & w_2(v) \\ x_3(s,t) & y_3(s,t) & w_3(s,t) \end{vmatrix} = 0$$

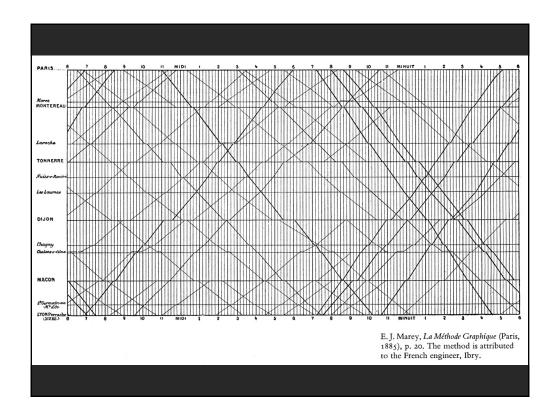

http://www.projectrho.com/nomogram/

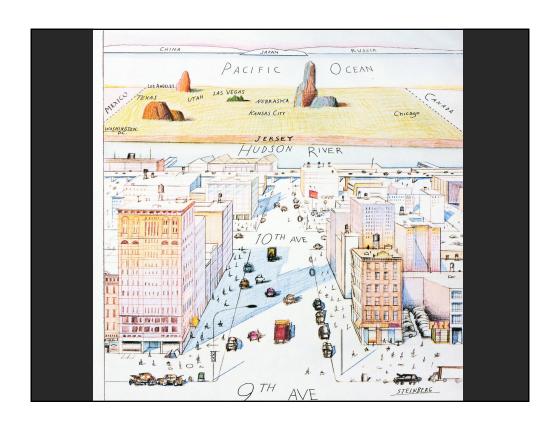

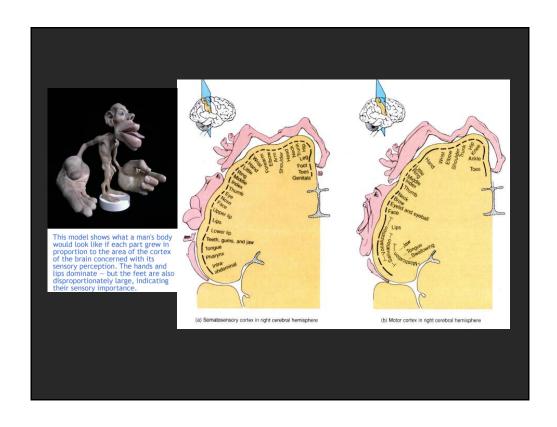

Focus + Context

Degree-of-Interest [Furnas 81, 06]

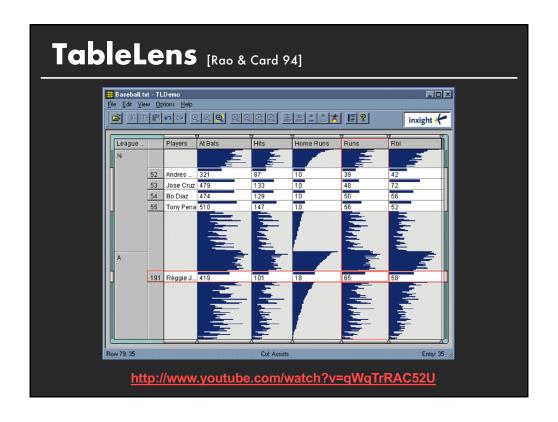

Estimate the saliency of information to display Can affect what is shown and/or how to show it

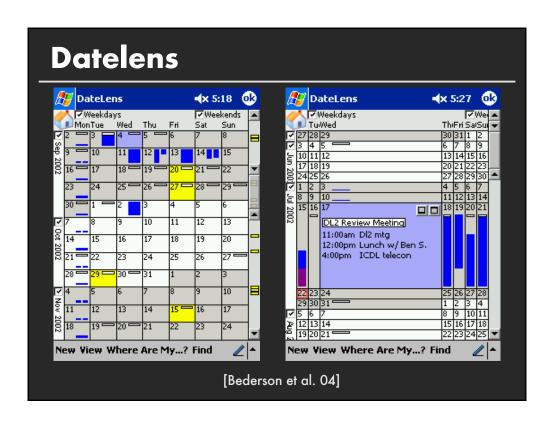

DOI ~ f(Current Focus, A Priori Importance)

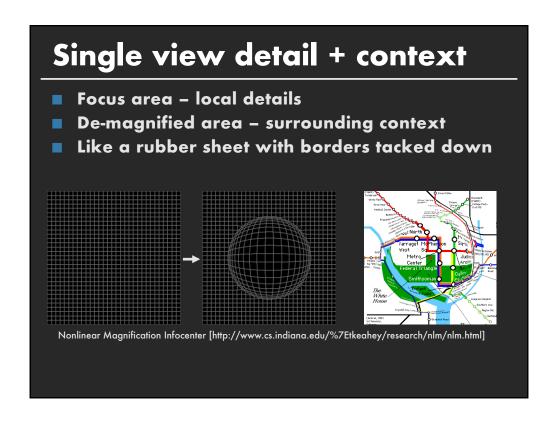

Example: Google Search

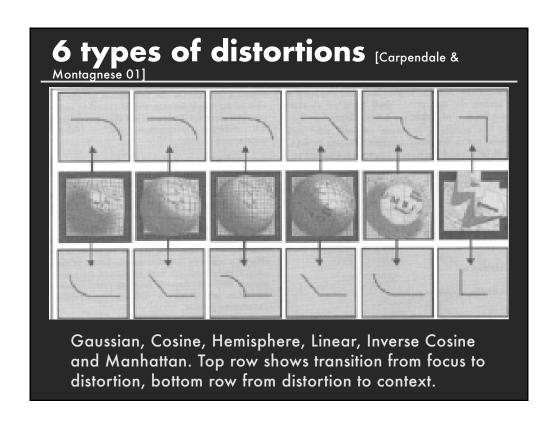

Current Focus = Query Hits (e.g., TF.IDF score)

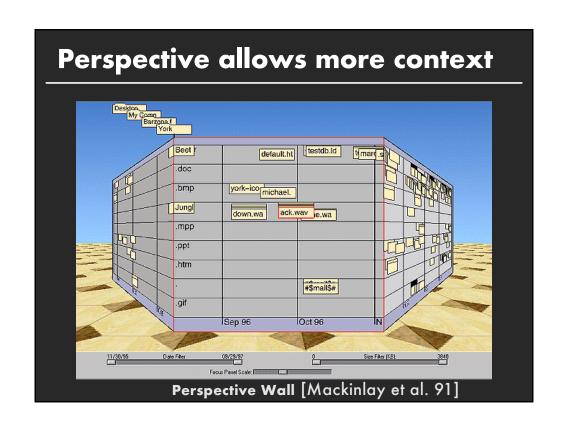

A Priori Importance = PageRank
What: Top N results, How: List

Distortions
